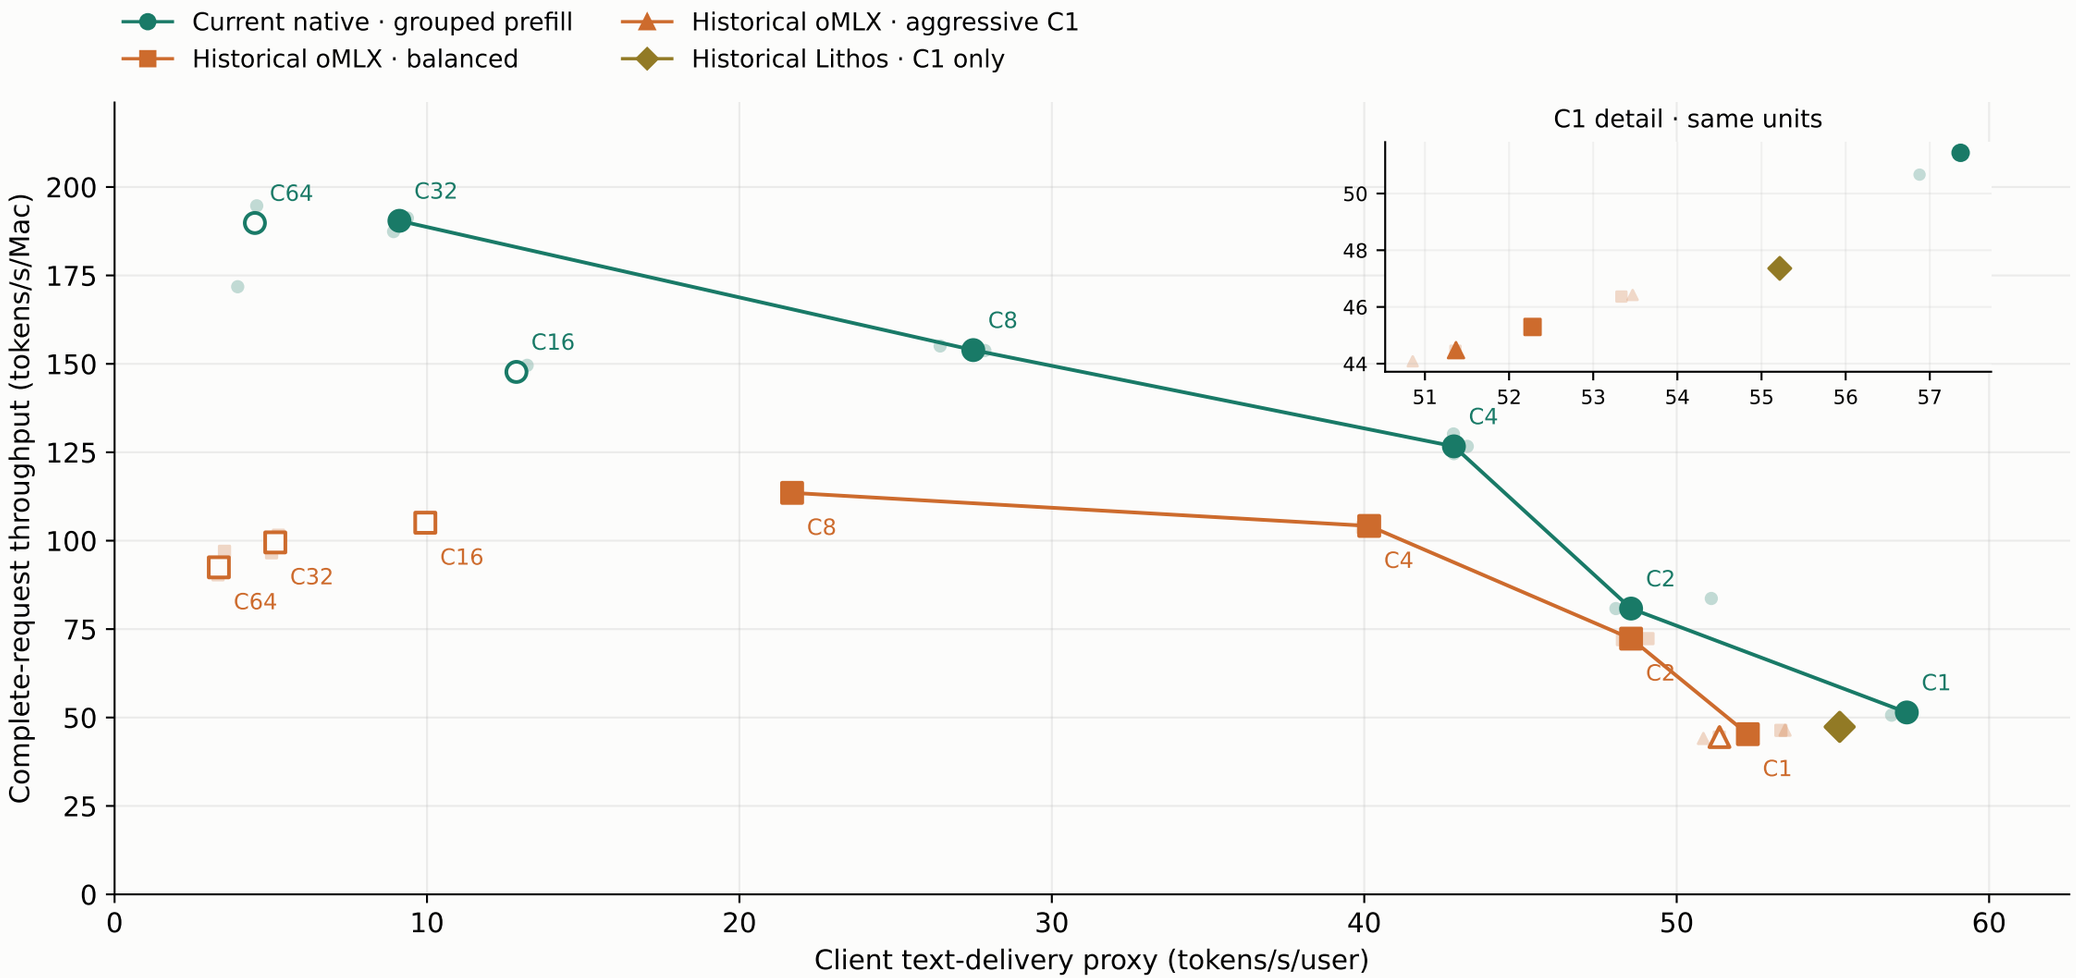
M5 Ultra · updated native Pareto measurements

256 GiB · Qwen3.8-27B NVFP4 · 19 input / 32 output · target-only decoding

9/9 archived external configuration medians covered by a measured current native point



Native: final core, C1/2/4/8/16/32/64, three fresh processes per point. External: earlier archived sweep.
Large marks: median of process medians; faint marks retain all processes. Spread is not a confidence interval.
Filled marks: frontier within each family. Lines are guides between measured configurations.
Three warm + three measured groups per process; greedy, normal EOS, no prefix cache or drafter.
Lithos uses the local M5 profile and supports C1 on its official endpoint. External engines were not rerun here.
Scope: this short workload only. Separate paired native results include TTFT and every raw sample.
