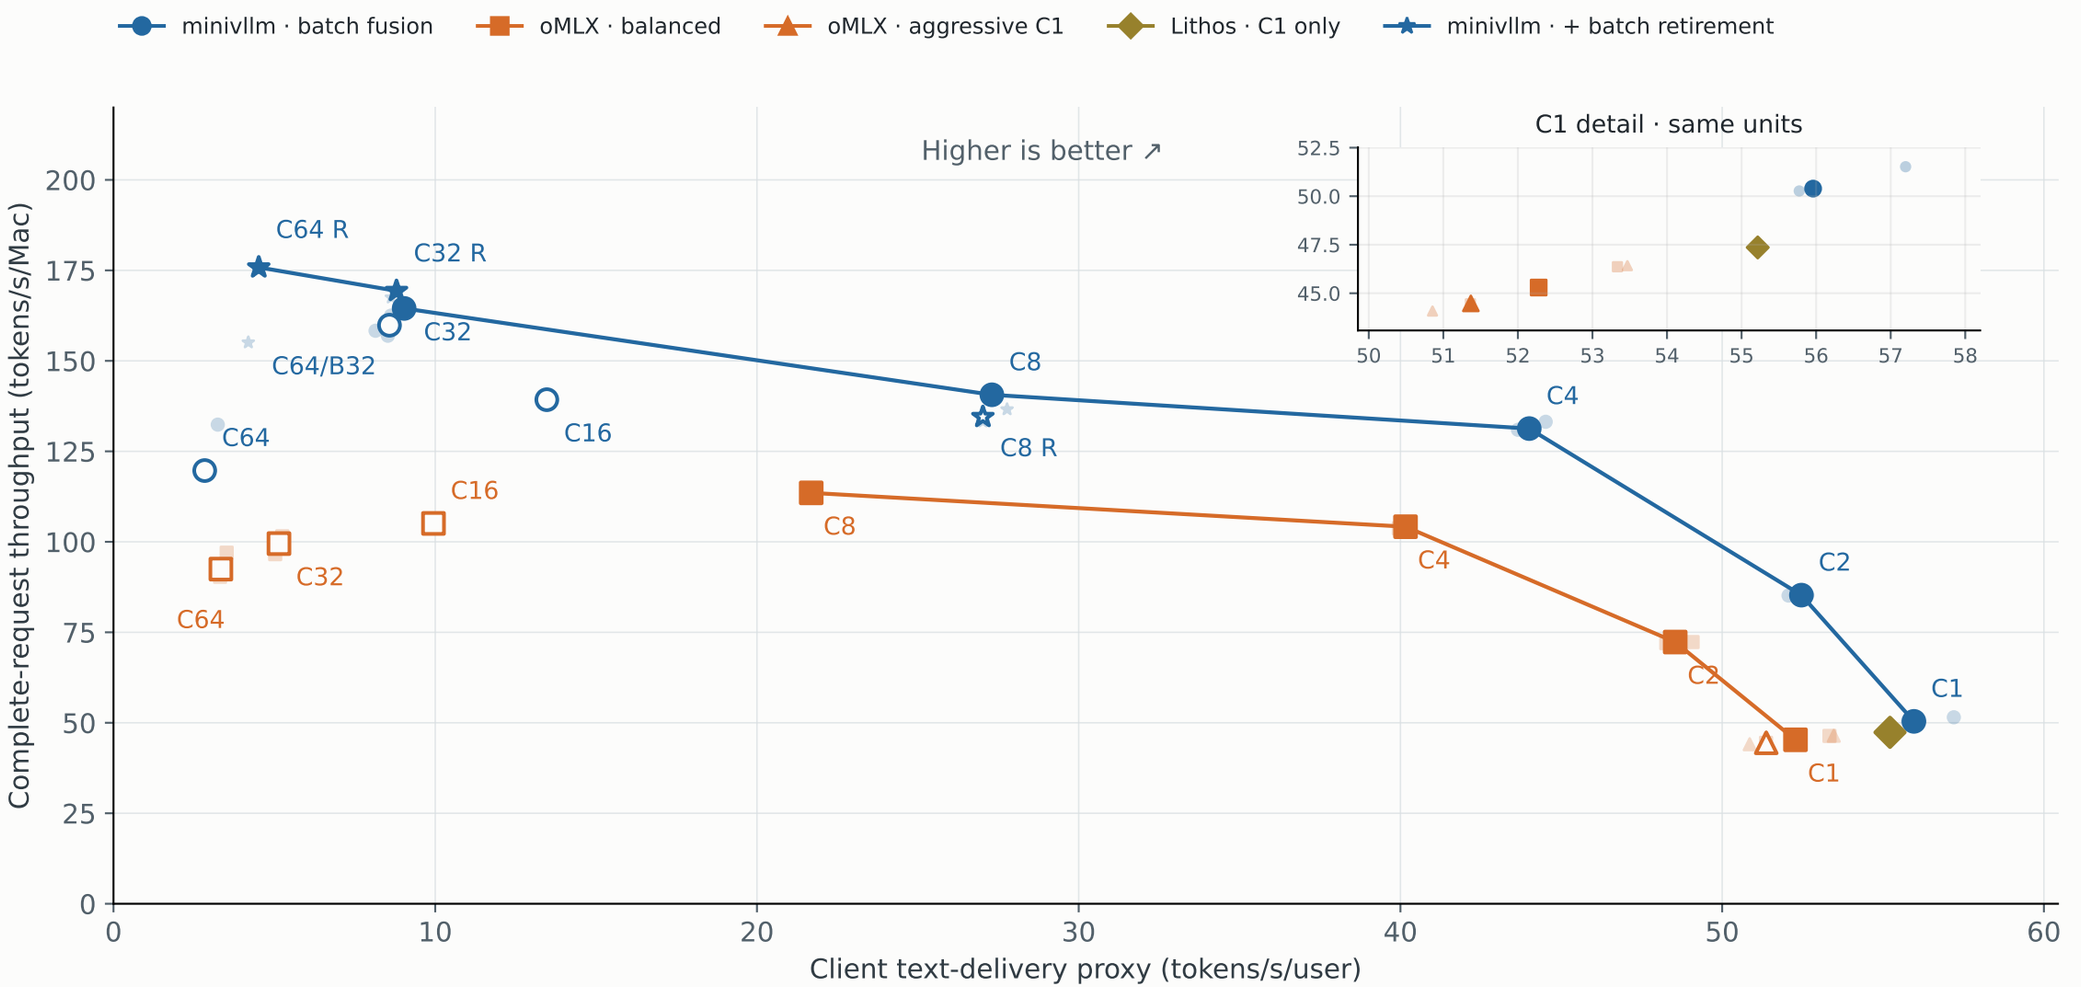
M5 Ultra · measured Pareto frontier

256 GiB · Qwen3.8-27B NVFP4 · 19 input / 32 output tokens · target-only decoding

9/9 external configuration medians covered by an actual minivllm point · C1–C64 sweep



Large marks: median of three process medians (three measured groups per process). Faint marks retain all processes.
Filled marks: frontier within each engine (native versions and oMLX modes combined). Hollow marks: dominated configurations.
Connecting lines are visual guides; intermediate configurations were not measured. Process spread is not a confidence interval.
Greedy, normal EOS, no prefix cache or drafter. Three warm groups precede measurement; all measured time retained.
Lithos uses a local M5 Ultra profile; its official HTTP endpoint supports C1 only. x is a delivery proxy, not raw GPU speed.
C64/B32 caps active sequences at32; R retires finished rows once per step. TTFT and all results are retained in the report.
